Issue reported

When moving between Products, Human Resources, Sales, and Payments, the page could keep showing the previous module’s records or selected subtab. Reloading the browser appeared to correct it.

Cause

These modules share one React component: RecordsPage. Its selected collection is initialized from the section prop only on the component’s first mount. React reused that component when the section changed, so its local collection state could remain set to a collection from the previous module.

What changed

Added a React key based on the active module when rendering RecordsPage. When the module changes, React now remounts RecordsPage, and its selected collection initializes for the newly selected module.

User-visible result

- Switching modules shows that module’s own records and starting subtab without a browser reload.
- Products starts on Products; HR on Employees; Sales on Transactions; Payments on Payments.
- This is a view/state correction; it does not change database queries, stored records, or permissions.

File changed

Client/src/App.jsx - one JSX line was updated in Dashboard module rendering.

Before

```
<RecordsPage section={currentPage.id} user={user} users={users}
  data={data} customers={customers} onSave={onRecordSave}
  onChangeState={onRecordState} />
```

After

```
<RecordsPage key={currentPage.id} section={currentPage.id} user={user}
  users={users} data={data} customers={customers}
  onSave={onRecordSave} onChangeState={onRecordState} />
```

Added / removed

- Added: key={currentPage.id} to force a fresh RecordsPage state per module.
- Removed: nothing. No other source code, data, or configuration was removed or changed.

Verification

- npm.cmd run build completed successfully.
- VS Code Problems check for App.jsx: no errors found.
- The build still reports an existing bundle-size advisory (main JS chunk just over 500 KB).

Note: This fix addresses module/subtab state being retained during navigation. If records are changed externally while the app stays open, use the app’s Refresh ERP data button to reload them.
